

1503471

Large Scale Systems Design

1503370

The course provides a description of the life cycle of large computer systems, and explains how it can be identified, their design and implementation. Systems Analysis is offered as a means to gather and organize information so that the required specifications closely correspond to the requirements of users. Then the course provides an explanation of design and converts requirements specification to the form that can be implemented. This is done through the use of tools that are available to manage and develop projects and large commercial software.
